

Check the delivery in

Keep the checks. Make comparison, acceptance and signing the learner’s work.

Recommended decision: approve an order-sheet-led design direction, not an app build. Retain three trolleys, ten quantity checks, six temperature checks and all four fish observations. Enter inspection results beside the evidence; give a few decisions depth and keep routine checks brief.

Intended outcome: the learner can explain what was ordered, what the supplier claims, what was checked, what is suitable to accept, and why the signed note must match that accepted amount.

Expert walkthrough, not learner research

This review follows the current source-defined journey and its completion rules. It identifies likely friction and learning risks; it does not claim observed student behaviour, measured usability gains or proven learning effects. A later learner trial would test those hypotheses.

Current sequence → two different problems

Current behaviour	Learner friction	Learning-design weakness
Note → trolleys → boxes → separate order sheet.	Repeated opening and closing separates evidence from the place it is used.	Comparing three sources becomes a memory/navigation exercise. The order sheet omits the supplier-claimed column. [S1, S2]
Guided inspection, notebook prompts, then “write up” every line.	Notebook capture and optional “Use my note” create a second pass; manual form entry is possible, so transcription is encouraged, not universally enforced.	Accurate transfer can dominate the decision. Quantity entry can itself mark a line counted, weakening evidence of actual inspection. [S1–S3]
Count/weigh reveals a fixed total; fish controls reveal findings.	Similar actions repeat across mostly normal goods.	Revealing a result is not counting competence. Four acknowledged fish findings do not show that the learner can interpret them. [S1, S4]
Enter temperatures and choose a status.	No receiving guidance is displayed alongside the readings.	Completion tests transcription accuracy, not comparison with a receiving limit; wrong statuses get count-focused feedback even when the issue is suitability. [S3, S4, S6]
Radio → amend → sign.	The last steps are easy to follow mechanically.	Guidance gives “four kilos” and “12...8”; the radio is an acknowledgement action, not a learner-authored report. [S2–S5]

Keep observation; remove avoidable repetition

Keep deliberate inspection of every product, settled readings, four fish findings, a status for every row, a report, an amendment and an explicit signature. Remove compulsory notebook transfer, repeated trips to paperwork and answer-bearing next-step prompts. Do not replace them with bulk acceptance.

Fact boundary: nine quantities match and all goods are suitable in this scenario. Salmon is short: 12 kg ordered/claimed, 8 kg received. Its impact is on **tomorrow’s lunch**, not tonight’s launch. The supporting flow document’s launch-impact sentence conflicts with the approved complication and dialogue; use the latter as the authority. No existing text has been changed. [S4, S7, S8]

One working order sheet, three sources

Make the order sheet the persistent receiving workspace, grouped by the existing trolleys. Opening a row brings its box, scales/count evidence, probe and relevant guidance beside that row. The learner writes each measured result directly into the row once. Closing an inspection leaves the sheet, evidence links and unfinished work available.

ANNOTATED WIREFRAME — SALMON ROW BEFORE AN ATTEMPT; NOT AN APP MOCKUP

Salmon fillet, skin on · Trolley 1: fish

A · Kitchen order	B · Supplier says	C · You checked	D · Your decision
12 kg Read-only order source	12 kg Exmouth Fish delivery note · open source	kg °C Inspect salmon · not checked	No status selected All here / Short / Refused Acceptance not decided

E · Inspection area:

open the goods, weigh them, wait for the temperature to settle, then write the readings in C. Reopen the same evidence without starting another paperwork trip.

F · Comparison:

“Does this match both pieces of paper?” The learner identifies the mismatch and writes the missing amount; no computed shortage is supplied.

- **A/B are claims, C is the learner’s work.** Keep the original order and supplier quantity visible after any amendment. Label the amended figure separately, with the learner’s initials.
- **Evidence is not a prefill.** Inspection controls reveal readings/findings, not completed fields. Typing alone must not count as inspection. “Open the next box” only navigates.
- **Quantity and suitability are distinct.** Preserve All here / Short / Refused. Alongside that status, require a deliberate choice to accept the checked amount or refuse it; no selection is prechosen. Short does not mean the delivered goods are unsuitable.
- **One saved result, several views.** The learner’s row supplies the later summary and report’s factual context. An optional notebook is for personal reminders, never a required transfer step.

Keep supplier documents correctly attributed

The current rendered note is **Exmouth Fish Suppliers’ fish-only note**. The order sheet labels Devon Fresh / Exmouth Fish jointly; non-fish claim amounts exist in the data, but individual non-fish document attribution is not established. Do not put all ten products on Exmouth’s note. Confirm the non-fish supplier/document mapping before producing new learner-facing paperwork. [S1, S5]

Equivalent phone and keyboard route

Desktop: sheet plus adjacent inspection. Phone: the same labelled row as an expanded card, with order and supplier claims above evidence and entry fields. A persistent “All ten items” list shows each item as unchecked, unfinished or ready to review; no default filter hides unchecked work. Return to the same row and scroll position.

Use semantic headings, labelled fields with units, radio groups for decisions, visible focus and keyboard-operable inspection controls. Announce settled readings and errors in text, not only colour. Return focus to the row after closing evidence; no drag-only, hover-only or precision-pointer action. Errors link directly to the relevant row and do not erase entries.

Retain every line, not every repeated trip

Review-only completed example: these are the scenario's expected outcomes, not values to prefill for learners. Initially all observed quantities, readings, statuses, acceptance decisions and shortage fields are blank. All ten items remain listed.

Annotated order-sheet example — quantities and temperatures unchanged [S4]

Trolley / item	Ordered	Supplier claims*	Learner checked	°C	Final status / acceptance
1 · Salmon fillet, skin on	12 kg	12 kg	8 kg	2.1	Short / accept 8 kg
1 · Sea bass, whole, gutted	10 fish	10 fish	10 fish	1.8	All here / accept 10 fish
1 · Smoked haddock, undyed	3 kg	3 kg	3 kg	2.4	All here / accept 3 kg
2 · Chicken supreme, skin on	96 pieces	96 pieces	96 pieces	3.2	All here / accept 96 pieces
2 · Double cream, 2 litre	6 bottles	6 bottles	6 bottles	4.0	All here / accept 6 bottles
2 · Unsalted butter, 250 g	20 blocks	20 blocks	20 blocks	4.4	All here / accept 20 blocks
3 · Baby spinach, 1 kg bag	8 bags	8 bags	8 bags	—	All here / accept 8 bags
3 · Banana shallots, 5 kg	2 sacks	2 sacks	2 sacks	—	All here / accept 2 sacks
3 · Lemons	60 each	60 each	60 each	—	All here / accept 60 each
3 · Flat-leaf parsley	10 bunches	10 bunches	10 bunches	—	All here / accept 10 bunches

*Fish claims link to the existing fish note. Other claims here come from scenario data, not a verified rendered supplier document. Confirm their source before presenting an attributed note. “—” preserves the current task's non-probed produce lines; it is not general food-storage guidance.

Proposed journey

- Orient at the back door.** Keep the approved situation, job and done-when wording. Make the order sheet and source documents immediately available; navigation does not name the fault.
- Try one normal line with support.** Suggest smoked haddock on trolley 1 as the first practice line; show how to inspect, enter and compare without doing it for the learner.
- Work through the three trollies.** Finish each row beside its evidence. Allow revisiting and non-linear selection; keep all remaining checks visible.
- Explain the important decisions.** Fish evidence, chilled-guidance comparison and packaging units get short focused prompts; routine lines need no written explanation.
- Prepare and send the discrepancy report.** The learner calculates the shortage and reports it to Terence; report preparation can begin when the mismatch is found.
- Correct the supplier's note.** Choose the affected line and accepted amount, preserve the original claim and deliberately initial the correction.
- Review, sign, then sign off the task.** Require all ten checks, six readings, four fish findings, decisions, report and correct amendment before the note can be signed. Preserve the existing separate task sign-off and read-only completed state.

Routine does not mean automatic: inspect → enter quantity/reading → compare → choose status and acceptance → move on. No “accept trolley”, no inferred inspection from typed answers, and no automatic advance when a probe settles.

Three trolleys, three emphases

1 · Fish: distinguish “short” from “not suitable”

Salmon sequence: open the order and Exmouth note (both 12 kg) → inspect and weigh the delivered salmon (8 kg), take its temperature (2.1°C) → enter those observations → identify that both documents claim more than is present → calculate $12 - 8 = 4$ **kg missing** → choose Short and deliberately accept the **8 kg of suitable goods**.

The condition decision uses the scenario’s suitable-goods finding and its own temperature evidence, not the quantity mismatch. The learner must not refuse acceptable salmon merely because some is missing. Do not add a condition defect or make the driver identify the discrepancy before the learner attempts it.

Whole sea bass sequence: count 10, read 1.8°C, inspect all four supplied findings: clear/bright/slightly domed eyes; deep red/wet gills; clean sea-like smell; firm flesh that springs back. Then choose acceptance and answer once: “Which findings support your decision?” Select the relevant evidence and write one brief reason, not four repeated descriptions.

Expected explanation, for reviewers only: “The count matches, the temperature meets the supplied guidance, and the eyes, gills, smell and flesh findings support accepting the fish.” All four findings must be inspected. The reason should connect the evidence to the decision, rather than merely say “I checked it”.

Use eyes/gills on whole sea bass, not salmon fillets or smoked haddock. The current controls share four fish flags across fish boxes; do not claim they establish separate sensory checks for each product. Smell and texture are **supplied scenario findings** (“What you notice”), not sensations the browser detects. Image/text alternatives show the same evidence. Any additional fillet-specific evidence requires content approval.

2 · Chilled: interpret, rather than only copy, a reading

Check chicken, cream and butter separately, retaining all counts and readings. Use butter (4.4°C) for one short comparison with an always-available **employer-supplied receiving guide**: “Does this reading meet the receiving guidance?” The learner points to the applicable guidance and chooses acceptance; chicken and cream then use the same reference with reduced prompting.

Approval boundary: current data specifies **5°C or below** for all six chilled lines, but this is not shown as learner-facing guidance. A proposed receiving card may use that existing scenario value only after the employer confirms its scope, wording and what to do outside it. Do not invent a threshold or import the fridge/chiller rules from other tasks. All six current readings meet the stored limit; butter is not a hidden refusal. Reading-entry tolerance and food acceptance criteria are different things. Until guidance is approved, do not describe this activity as teaching a validated workplace safety rule.

3 · Fruit and veg: compare the right packaging/count unit

Existing-facts option: inspect two 5 kg shallot sacks. Ask “Does the order ask for sacks or kilos?” Enter **2 sacks**, not 10 in a sacks field. The same goods total 10 kg, but the order is for two sacks. Count spinach as 8 bags and parsley as 10 bunches; inspect and count all 60 lemons.

Optional new packaging proposal: show lemons in three trays of 20, retaining 60 lemons in the order, claim and delivery. Let the learner inspect the contents, not infer them solely from a carton label, then enter 60 each rather than 3 trays. **This packaging is not current content.** It needs approval and suitable evidence; the existing sack example is enough for the core recommendation.

No new refusal is needed. Most deliveries should be routine; the activity is not ten fault-finding tricks.

Attempt first; explain and correct second

Keep answer-bearing information out of navigation

Currently the fish guide gives the finding before the observation; later prompts explicitly give four kilos missing and the 12-to-8 amendment. The “Next” strip gives the same correction. The approved complication can appear after *any nonblank salmon amount*, because entering an amount also sets counted; correct comparison or a shortage attempt is not required. The driver reacts to 8, and the radio reply supplies the solution. [S2–S7, S9]

Proposed disclosure gate: keep approved strings unchanged, but withhold the answer-bearing complication, driver response and solution-bearing radio reply until the learner has inspected salmon, entered quantity/temperature, compared order and note, and attempted status, accepted amount, shortage and an amendment amount. “Attempted” need not mean correct. Preparation of the amendment happens on the sheet; the supplier note remains unsigned.

Then show the approved complication verbatim. It supplies the service context: tomorrow’s lunch needs salmon; tonight’s launch does not. Learners need not guess that fact. They finish their report using it. Terence’s existing answer-bearing reply follows the report attempt, as corrective confirmation rather than the first source of the learner’s decisions.

PROPOSED REPORT TO TERENCE — SHORT, STRUCTURED, LEARNER-AUTHORED

Facts: choose the affected product; reference the learner’s saved quantity and source claims. The missing amount is the learner’s calculation from the comparison, not auto-generated.

Your message: “What is missing, what can you accept, and what needs following up?”

Service affected: “Which meal needs this, and what do you need Terence to do?”

Acceptable example, for review/feedback only: “Terence, salmon is 4 kg short: the order and note say 12 kg but I checked 8 kg. The 8 kg delivered is suitable to accept. Tomorrow’s lunch needs the missing amount, not tonight’s launch. Can you follow up with the supplier? I’ll correct the note to the amount accepted before signing.”

Keep the report to a few sentences, not ten explanations. Sending the radio message is a deliberate action; clicking a radio alone is not evidence of reporting. Check its factual fields and meaning, allow plain-language variants, and do not require an exact phrase or silently treat any non-empty text as a correct explanation. Automated free-text judgement is not assumed by this recommendation.

Make the amendment a document decision, not another notebook pass

The learner selects salmon on the **fish supplier’s note**, strikes the original 12 kg, and chooses the accepted amount from their saved work, or enters an amendment themselves. The recommended single-entry route uses the learner’s own proposed amount only after an explicit “Use my amount” action. It never substitutes the hidden correct answer. Original claim, amended amount and initials stay visible. The learner signs for **8 kg accepted**, not 12 claimed or 4 missing. Neither initials nor signature is applied without an explicit action.

Recover before sign-off

“Review before signing” identifies unresolved checks and contradictions with links to their sources. Retain wrong entries as editable drafts, allow reinspection and resending a corrected report, and recheck dependent decisions after a quantity changes; never silently repair them. If work changes after the note is signed but before task sign-off, require explicit re-signing. Once the task is signed off, preserve the existing frozen, read-only result and completion identifiers; review and hints must not mutate it.

Teach the method, then reduce the prompts

One supported normal example: smoked haddock

1. Show the order's 3 kg and the fish note's 3 kg as two labelled claims.
2. Prompt "Weigh what came in." The scale reveals 3 kg; the learner writes it in the row.
3. Prompt "Take the temperature." The learner waits, reads 2.4°C, writes it once and uses the approved receiving guidance when available.
4. Ask "Does this match both pieces of paper?" and "Will you accept what you checked?" Leave quantity, status and acceptance unselected; the learner chooses them.
5. After their attempt, explain why the matching quantity and suitable condition support All here / accept 3 kg. Keep this example available to reopen, never impose it as ten repeated scripts.

Next, salmon gets the comparison question but no arithmetic answer; sea bass gets the evidence question; butter gets one guidance comparison; shallots get one packaging question. Remaining rows keep evidence, fields and the reference available with only neutral navigation: "Open the next box", "Check your entries", "Prepare your report".

Optional hint ladder

Level	Support on request	Boundary
1 · Find	"Open the fish note beside your check."	Points to a source, not the answer.
2 · Compare	"Which amount is on the paper, and which did you weigh?"	Names the relationship, not the shortage.
3 · Method	"Subtract what arrived from what was ordered. Sign for what you accept."	Provides the method; fields remain learner-owned.
4 · Work it through	After an evidence-backed attempt, show $12 - 8 = 4$ and distinguish 8 accepted from 4 missing.	Explicit help on request; learner corrects and confirms, with no penalty or automatic field changes.

Feedback points back to the source that resolves the error

Attempt	First corrective feedback	Recovery
Writes the note's 12 kg as observed salmon.	"That matches the supplier's note. Compare it with your scales."	Open salmon evidence; edit the saved result.
Marks salmon All here or Refused because it is short.	"Compare the quantity with the order, then check whether the goods themselves are suitable."	Revisit quantity and condition; choose status and acceptance separately.
Rejects butter because 4.4 sounds high.	"Compare that reading with the receiving guidance for this delivery."	Open approved guidance; keep the measured value, reconsider acceptance.
Accepts fish with no supporting explanation.	"Which of the fish findings supports accepting it?"	Reopen four supplied findings and revise the brief reason.
Writes 10 in the shallot sacks field.	"The bag size is in kilos. What does the order ask you to count?"	Inspect labels and contents; enter the number of sacks.
Reports tonight's launch as affected; or amends to 4 kg.	"Check which meal Terence says needs it." / "Does this amount mean missing or accepted?"	Reopen the revealed context or accepted-amount entry; revise, then resend or re-sign.

Feedback follows an attempt, not a keystroke that reveals the answer early. Separate missing evidence, a misread value, a unit error and a wrong decision. Provide a route back without points, timers, penalties or a full-task restart.

What to approve, and what to hold back

Priority	Recommendation	Decision needed
1 · Core Existing facts	Persistent sheet; direct result entry; all checks retained; learner-owned shortage, acceptance, report and amendment; later answer disclosure; repair before sign-off.	Approve the design direction. Any build remains a separately authorised task.
2 · Teaching Existing data, new presentation	Use whole-fish evidence and existing sack sizes; provide scoped receiving guidance; make supplier claims traceable.	Employer validates fish teaching, the receiving card and non-fish supplier/document attribution before learner-facing use.
3 · Optional New scenario evidence	Lemon trays of 20; additional product-specific evidence; a separate refusal practice case, only if useful.	Approve new evidence/assets and any refusal guidance. None is required for the core design.

Optional refusal extension: a separate practice delivery could supply an employer-authored unsuitable-condition finding and ask the learner to apply the supplied guidance, report it and refuse that item. The employer must define the product, evidence, action and acceptance rule. Do not turn a current acceptable line into a fault, invent unsafe temperatures or treat this extension as approved scenario truth.

How to judge the design in a later learner trial

- **Comparison:** without the explicit answer hint, the learner distinguishes ordered/claimed 12 kg from observed 8 kg, calculates 4 kg missing and explains why 8 kg is accepted and signed for.
- **Evidence:** explains fish acceptance using inspected findings; interprets a chilled reading using the supplied guidance; counts packaging in the order's unit.
- **Communication:** their short report names the discrepancy, suitable amount, tomorrow's lunch and supplier follow-up. It does not invent an effect on tonight's launch.
- **Coverage and recovery:** no unchecked row disappears; all ten quantities, six temperatures and four fish observations are completed. A mistaken value/status/report/amendment can be repaired before sign-off; signed-off work stays read-only.
- **Accessibility and effort:** the same evidence and decisions are reachable by phone and keyboard. Check whether duplicate entry and navigation decrease, not whether students finish faster under pressure. Observe assistance used; do not add a learner score or timer.

A correct final form alone is insufficient evidence of independent judgement. Ask "Why accept this?", "What is missing?" and "Why amend to that amount?" after the attempt. Distinguish independent reasoning from an answer reached with explicit help; both can finish after correction. This is a proposed review method, not a claim that user testing has occurred.

Source register — current activity, not external learner research

Paths below are relative to `artifacts/try-day/`. Line ranges identify the reviewed version.

S1 `src/components/scenes/delivery/goods-in.tsx:128–182, 349–509, 522–754` — inspection, notebook, sheet, fish-only supplier note, statuses and signature controls.
